

SGX3'S
FACULTY HACK
GATEWAYS' 24

Training for Faculty Mentors

9/12/24 18:00 - 20:00 ET

Agenda

- Welcome from Dr. Sandra Geising, *SGX3 PI*
- Overview of the Faculty Hackathon Logistics
- Deliverables (GitHub, Poster Template, Blog Post)
- First Steps when meeting your faculty by Elijah Maccarthy
- Lessons Learned from past Faculty Hacks by John Holmen
- What Mentors are asked to share with the faculty
- Mentor's contribution by Dr. Bernadette Boscoe
- Mentor's contribution by Dr. K. Munene
- Faculty/Mentor teams for 2024

Overview

Event Information

The hack will begin with a series of virtual sessions and will conclude with an in person poster presentation of team findings at the Gateways 2024 conference.

Schedule:

September 16th - 20th, 2024 (6pm - 8pm ET) - Virtual Sessions [Two optional sessions Sept. 16th and 19th]

October 8th - 10th, 2024 - Poster Session [[Gateways 2024 will take place in Bozeman, MT.](#)]

Overview

The FacultyHack@Gateway2024 will involve 10 Computer Science or science discipline area faculty. Faculty teams will adapt High-Performance Computing (HPC) tools for use in their courses. They will leave with "ready-to-go" course outlines, supporting data, and identified resources. Each team will be assigned a technical mentor to help with this process. Teams completing all four (4) challenges receive a \$1000 honorarium.

Challenges:

Attend all HPC training sessions Attend the Gateways 2024 conference in Bozeman, MT (Travel support is provided); Make a poster presentation of revised courses at Gateways 2024; Produce a Blog Post on your SGX3 Curriculum project which will be uploaded to sciencegateways.org/networking-community/blogs; GitHub repository with poster, README.md, description and code/datasetws

Outcomes:

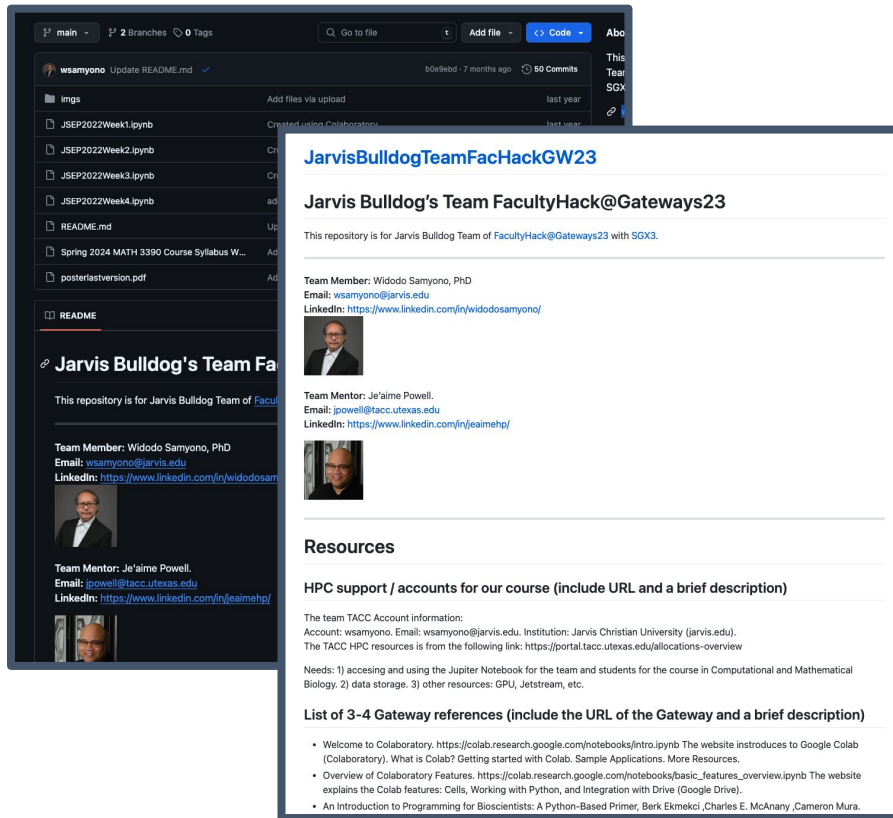

A completely revised course description with implementation schedule. Assignment of a Gateways community mentor to provide use cases, resources and next step suggestions. Robust access to HPC resources for research and instruction. Opportunities to collaborate with other HPC educators and technical personnel. Enhanced computer science courses with HPC content at the home institutions.

Deliverables

- GitHub Repository
 - README.md
 - Project description
 - Blog post
 - Code/Datasets
 - Poster
 - Curriculum
- Poster presented at Gateways24

GitHub Example

The screenshot shows a GitHub repository page for 'JarvisBulldogTeamFacHackGW23'. The repository is owned by 'wsamyono' and has 50 commits. The repository description is 'This repository is for Jarvis Bulldog Team of FacultyHack@Gateways23 with SGX3.' The team member listed is 'Widodo Samyono, PhD' with email 'wsamyono@jarvis.edu' and LinkedIn 'https://www.linkedin.com/in/widodosamyo/'. The team mentor is 'Je'aima Powell' with email 'jpowell@tacc.utexas.edu' and LinkedIn 'https://www.linkedin.com/in/jeaimhp/'. The resources section includes 'HPC support / accounts for our course (include URL and a brief description)' with details about TACC account information and HPC resources. The 'List of 3-4 Gateway references (include the URL of the Gateway and a brief description)' includes three references: 1) 'Welcome to Colaboratory' (https://colab.research.google.com/notebooks/intro.ipynb), 2) 'Overview of Colaboratory Features' (https://colab.research.google.com/notebooks/basic_features_overview.ipynb), and 3) 'An Introduction to Programming for Bioscientists: A Python-Based Primer' (https://github.com/charles-mcany/python-based-primer).

Sample Poster from 2022

Title: Integrating High Performance Computing (HPC) In An Introductory Java Programming Class

Revised Course Description
 COURSE NUMBER: CSC211 1311
 COURSE TITLE: Computer Programming II
 SEMESTER HOURS: Three (3)
 PREREQUISITE: CSC211 1310
 SEMESTER: Spring 2022

This course offers continued development in program design. Larger programs are introduced incorporating string and file processing, recursive methods and the standard library. Programs are executed in high-performance computing environments. Laboratory work required. Prerequisite: CSC 1110.

Implementation Schedule

Date	Lecture/Activity
1/12/2023	Introduction to the Course
1/17/2023	Introduction to High Performance Computing / HPC Crash Course
1/18/2023	HPC Crash Course (cont.)

Sample HPC/Gateways Exercise
 All programming projects will be done using the Visual editor on the ORNL's Ascent cluster.

Program using one-dimensional arrays (1 week)
 Program using searching and sorting (1 week)
 Program using two-dimensional arrays (2 weeks)
 Program using text processing (1 week)
 Program using inheritance (2 weeks)
 Program using exception handling (1 week)
 Program using recursion (1 week)

Resource Needs/List

- Accounts for faculty and students to access the ORNL's Ascent cluster
- Hands-on Java exercises suitable for HPC
- Computational resource allocation on the ascent cluster. Ascent node structure (shown below)

Use Cases

• We will use Java on ascent for matrix-vector and matrix-matrix multiplications.

• We will also attempt using Java on Ascent for MPI programming.

Instances where Java has been used in HPC in the past include in the development of BLAS X10 language used within HPC environments. X10 is designed to make best use of NUMA characteristic for parallel programming.

Another use case is in the development of Titanium, language for developing parallel scientific software.

Possible Extensions

- For possible extensions to HPC, usage in the embedded programming space, we will consider a Java-to-C++ bridge.
- Parallel tasks on CPU.
- Port tasks to GPUs.
- Database and scientific applications.

Acknowledgements

• ORNL's Ascent Cluster

- Hands-on Java exercises
- Hands-on HPC specific exercises:
 - Message Passing Interface (MPI) Basics
 - OpenMP Basics
 - Matrix-Matrix Multiplication

Gateway Community Mentor Syllabus Suggestions

COURSE GOALS:
 Provide computer science students with the skills to:

- Continue developing critical thinking, a disciplined approach to the design, coding, and debugging of programs written in a block-structured high-level language.
- Understand the use of data abstraction using basic data types such as strings, multidimensional arrays, lists, and data structures such as linked lists.
- Understand searching and sorting algorithms and their analysis.
- Provide a foundation for further studies in computer science.
- Execute programs on high-performance computing systems.

Goal 6 - Introduction to High Performance Computing

- Accessing the HPC clusters using ssh clients
- Linux command line environment, Vim editor
- Running batch jobs
- Accessing and managing directories

 **Best Poster Award Gateways 2022**

Sample Poster from 2023

Scaling Up: Incorporating HPC experience into an undergraduate Introduction to Data Science course using Gateways with Jupyter notebooks and GPU-enabled instances

Revised Course Description

The revised course description will add a new module, **Data Science using a GPU-enabled HPC** at the end of the quarter-length course.

CS 356: Special Topics- Introduction to Data Science
The goals of this course are to learn how to acquire, clean, analyze, and visualize data using Python, libraries including Pandas, and Jupyter notebooks.

In the revised description, the added module will have students explore an HPC platform, detect GPUs in their Jupyter notebooks, and load a large dataset to build a machine learning model. Given code to train a model, students will learn how to run jobs on the HPC cluster, and store results for analysis.

- Learning outcomes:**
Students will
- Familiarize themselves with HPC environments and workflows to do analytic tasks
 - Move data and code into the compute space, build a machine learning model, save it, and test it
 - Utilize GPUs for training and explore the exciting realm of HPCs for scientific research

Implementation Schedule

Fall 2023:
Explore Gateways resources, using ACCESS-CI obtain accounts for instructor and ensure availability for ~25 students to have their own spawned containers

Winter 2024:
Develop Jupyter notebooks, load data and notebooks into an instance for testing, check for compute-credits needed to run the module, budget as needed

Spring 2024:
Begin course, add and test student accounts, implement module

Summer 2024:
Refine/refactor material, prepare for second offering Fall 2024/Winter 2025

Sample HPC/Gateways Exercise

Image classification using machine learning is an effective way to introduce HPCs and the necessity of GPUs to newcomers.

We explore Cropnet classifier¹, a Tensorflow model that takes images of cassava leaves as input and detects various diseases if present. Cassava root is a major source of food across the world.

Previous to this exercise, students will have already studied the cassava project and its aims, and tested the existing trained model and code. Now, the focus is on retraining the model using GPUs on a cluster, in a platform. In this exercise, students write code to 1) detect GPUs, load the training, test, and validation sets, and train the model and save it.

```
! plot(examples, predictions)
```

¹ <https://github.com/gongw/machine-learning-for-science/blob/master/132>

Resource Needs/List

- o HPC Platform that allows for ~25 student accounts GPU access, ideally GitHub authentication to access containers
- o Jupyter notebooks in HPC environment, each student with JupyterHub spawned Kubernetes cluster
- o Way to load and download data
- o Compute credits to train ~25 ML models

Gateway Community Mentor Syllabus Suggestions

Mentors suggested to show the utility of using HPCs at scale, and to experience what happens when local computers cannot compute certain tasks requiring a GPU.

Proposed activity: Have students attempt to train the model on their laptops or desktops. It will likely fail, or take a considerable amount of time.

Next, have students try to train the model on the free version of Colab. Here, too, it will likely fail, timeout, or take a considerable amount of time to run.

Next, have students train the model on an HPC instance. Students will see the necessity and efficacy of using HPC instances to train machine learning models requiring GPUs.

Resources / Science Gateways

- JupyterHub: for notebooks
- TACC: for clusters and jobs
- Jetstream2: for clusters and jobs
- Exosphere: for interfaces
- SciServer: for domain science resources

Use Cases

- Students will access TACC [1] to learn how to familiarize themselves with cloud-browser-based platforms, log in to an instance, and understand how to run jobs
- Students will use Jetstream2 to have their own container spawned for them, see pre-loaded configurations and then add libraries as needed
- Students will use exosphere to explore GUI interfaces to Jetstream2
- Students will use SciServer for domain science examples and compute environments

Special Thanks

Charlie Dey, Texas Advanced Computing Center
Ja'elme Powell, Texas Advanced Computing Center
Linda Hayden, Elizabeth City State University

Datasets

- Cassava leaf image dataset:
<https://www.tensorflow.org/datasets/catalog/cassava>
- Kaggle competition:
<https://www.kaggle.com/c/cassava-disease/overview>

Possible Expansions

- From the Cassava disease detection model, students can create a TF-lite app to deploy and run on mobile phones to detect plant disease in the field
- Deploy a Cassava disease detection model to run on an endpoint and provide a method to upload images and detect them in batch or real-time
- With more cassava plant disease data or even different plant disease data, build a transfer learning model and test its efficacy and deploy it via an endpoint or a mobile app

Practical Introduction to HPC and Research Computing

CAMSA Team

CAMSA
FACULTY-HACK

4: Syllabus

- This course provides exposure to advanced topics in computer networks including recent research findings in this field. The topics include: internetworking, Internet concept, Client-server model for applications, Network and internet management. Also, this course covers recently emerging protocols and technologies such as: Virtualization and Software Defined Networks (SDNs), IPv6, wireless networks, Secure Socket Layer, and Transport Layer Security.
- The course integrates also hands on labs about the usage of High-Performance Computing (HPC) in computer networks and other computing Disciplines. The goal is to allow students to use such resources in their other courses or future research or experiments.

5: Sample Exercises

- In the past I used existing public materials in testbeds such as Geni.net, XSEDE, Deterlab, etc. Additionally, I provide samples of my own experience implementing those experiments and my own feedback to previous students.
- There is one particular example I used and like this year is ChameleonCloud shared experiments portal: (<https://www.chameleoncloud.org/experiment/share/>)
- The portal focuses on an idea that I like (reproducibility), and allows users to submit their feedback and also their own experiments.
- I am planning also to utilize the new TAMU cluster ACES (<https://portal-aces.hprc.tamu.edu/pun/svs/dashboard>)
- I am a member of SWEETER grant with TAMU with the aim of enabling the spread of usage of HPC resources across A&M system and the region.

6: Supporting Gateways

- <https://access-ci.org/>
- <https://hprc.tamu.edu/>

Title: Integrating High Performance Computing (HPC) In An Introductory Java Programming Class

Approved Course Description

Approved course number: 198
 Approved title: Introduction to Operating Systems
 Approved credits: 3 credit
 Approved semester: 2023-24
 Approved year: 2024

The course offers students the opportunity to explore advanced topics in operating systems, including file systems, process management, and network protocols. The course is designed to provide students with a solid foundation in the principles of operating systems and their implementation.

Gateway Community Mentor Solutions Suggestion

LEARNING GOALS:
 Research computer science students with the skills to:
 • Collaborate, developing critical thinking, a shared goal approach to the design, coding, and debugging of programs written for a Java-based high-level language.
 • Demonstrate the use of data structures using basic data types, lists, and arrays.
 • Implement recursive, iterative, and sorting algorithms and their analysis.
 • Apply a methodology for better coding in computer science.
 • Evaluate program output, performance, and debugging systems.

Goal 1: Introduction to High Performance Computing (HPC)

- Maximizing the HPC cluster using MPI.
- Using compiled libraries and the MPI.
- Learning built-in MPI.
- Managing and managing resources.

TEAM RAMS

FRONTIER

Requirements for MPI

- Account for both MPI and MPI-2.
- MPI-2 is not supported for all MPI-2.
- MPI-2 is not supported for all MPI-2.

Use Cases

- MPI is used for parallel computing.
- MPI is used for parallel computing.
- MPI is used for parallel computing.

Prerequisites

- MPI is used for parallel computing.
- MPI is used for parallel computing.
- MPI is used for parallel computing.
